

DIESEL FUEL CLEANING SERVICE

HM Cragg offers diesel fuel cleaning to *recondition, stabilize* and *decontaminate* your fuel

Fuel purity is vital to the efficiency of a backup power system. Over time, unused fuel can collect water, sediments, sludge, microorganisms and other contaminants. If left untreated, this could cause a failure to your uninterruptible power supply.

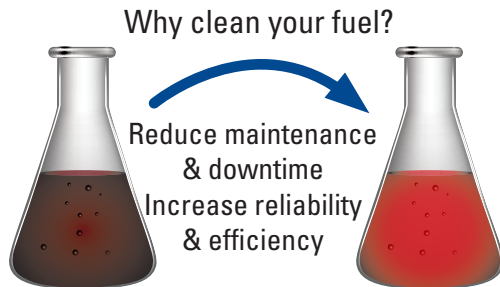

DIRTY FUEL CAN CAUSE REAL PROBLEMS

WATER - Over time, heat, light and air can cause an increase in water. Water doesn't mix with diesel fuel, and it settles to the bottom creating an ideal environment for microbes to grow.

BACTERIA - Once microbes are in your tank, they feed on the hydrocarbons in the fuel and create biomass, biofilms and other damaging by-products.

SLUDGE - The bacteria produce waste that causes the fuel to become darker and thicker.

The bottom line is dirty fuel can cause: tank leaks, clogs in your filter/injector and loss of combustibility.

HM CRAGG HAS YOUR SOLUTION

HM Cragg's mobile tank cleaning system will *recondition, stabilize, and decontaminate* your fuel. This will reverse the degradation process and restore and stabilize the overall quality. Here's how it works:

- Separator/coalescer removes water and particles
- Fuel reconditioner reverses the fuel degradation process, removes the buildup of tank sludge and stabilizes fuel
- Filtration process removes emulsified water and any other solids, decreasing the mass and size of fuel droplets

The end result is decontaminated and clear fuel, a cleaner tank and efficient combustion.
